DIMEX

DimeX Chain

WHITEPAPER

A foundation for an accessible, EVM-compatible digital ecosystem

PROJECT	DimeX Chain
NATIVE COIN	DMXC
TOTAL STATED SUPPLY	10,000,000,000 coins (10 Billion)
NETWORK CHAIN ID	1723

PROJECT INFORMATION DOCUMENT • VERSION 1.0 • 11 NOVEMBER 2026

Important Notice

This document is an informational project whitepaper. It describes the DimeX Chain project, its currently stated network parameters and its development direction. It is not an offer to sell, a solicitation to buy, investment advice, legal advice, tax advice, or a promise of returns. Digital assets and blockchain networks involve substantial technical, market, operational and regulatory risks.

Information about features, integrations and future development is subject to change. Roadmap items are objectives, not guarantees or fixed delivery commitments. Readers should independently verify network details and obtain qualified professional advice where appropriate.

Document Status

Prepared as a project information draft for review by the DimeX Chain team. Before public release, confirm the supply statement against the deployed genesis/network records, confirm all technical parameters against the live chain, and obtain legal review for applicable jurisdictions.

Contents

- 1. Executive Summary
- 2. Project Overview
- 3. Vision, Mission and Principles
- 4. Network Architecture
- 5. DMXC Native Coin and Supply
- 6. Genesis Allocation and Token Distribution
- 7. Ecosystem and Use Cases
- 8. Security and Network Operations
- 9. Development Roadmap
- 10. Governance and Compliance Considerations
- 11. Risk Factors
- 12. Disclaimer and Glossary

1. Executive Summary

DimeX Chain is an EVM-compatible blockchain network intended to provide public infrastructure for digital asset activity, wallet connectivity and ecosystem applications. The project focuses on accessible network participation, transparent on-chain verification and compatibility with familiar Ethereum Virtual Machine tools.

The DimeX ecosystem includes the DimeX Chain network, the DimeXScan block explorer and DimeX exchange services. The long-term direction is to strengthen core infrastructure, improve developer resources and pursue responsible integrations as technical and regulatory conditions permit.

2. Project Overview

DimeX Chain is presented as a dedicated blockchain network with its own chain configuration and native coin. The public network configuration identifies Chain ID 1723, an EVM-compatible execution environment and QBFT consensus.

Core Network Information

PARAMETER	CURRENT PROJECT INFORMATION
Network name	DimeX Chain
Chain ID	1723 (0x6BB)
Native coin ticker	DMXC
Stated total supply	10,000,000,000 coins (10 Billion)
Decimals	18
Consensus	QBFT
Execution compatibility	EVM
Public RPC	https://rpc.dimexchain.tech/
Block explorer	https://www.dimexscan.tech

3. Vision, Mission and Principles

Vision

To build an accessible and dependable blockchain ecosystem that can support developers, users and digital services over time.

Mission

To maintain usable network infrastructure, improve developer access, encourage responsible ecosystem integrations and publish clear, verifiable technical information.

Operating Principles

- Transparency in public network information and project communications.
- Security-conscious engineering, testing and operational maintenance.
- Interoperability through EVM-compatible tools and standards.
- Responsible growth, with future services introduced only when ready and appropriately reviewed.

4. Network Architecture

DimeX Chain uses an EVM-compatible execution environment. This design is intended to support familiar account models, wallet workflows and smart-contract development patterns used across EVM networks.

QBFT Consensus

The project identifies QBFT (Quorum Byzantine Fault Tolerance) as its consensus mechanism. QBFT is a Byzantine-fault-tolerant consensus approach used in permissioned or validator-managed blockchain networks. The precise validator configuration, validator membership, fault assumptions, block timing and operational procedures should be documented from the live network configuration and validated by the technical team.

Network Access

Users and applications can configure compatible tools using the published RPC endpoint and Chain ID. The DimeXScan explorer provides a public interface for reviewing blocks, transactions and addresses. Availability and performance depend on the underlying infrastructure and may vary.

5. DMXC Native Coin and Supply

DMXC is the native coin symbol used by the DimeX Chain network configuration. The project states a total supply of 10 billion coins (10,000,000,000). The supply statement should be reconciled with the genesis configuration and any protocol-level minting or burning rules before publication.

Potential Ecosystem Utility

- Native network asset used for transaction fees, if configured by the protocol.
- Potential use in ecosystem applications and integrations as they are implemented.
- Potential support for exchange and wallet integrations, subject to technical and regulatory review.

The above utility descriptions distinguish current network configuration from potential future use. They should not be read as a guarantee that every listed integration or function is already available.

6. Genesis Allocation and Token Distribution

The project team has indicated that the initial coin allocation is already defined in the network genesis configuration. This whitepaper does not create or amend that allocation. A public allocation table should be inserted only after the exact genesis allocation categories, percentages and wallet/account references have been checked against the authoritative genesis records.

Recommended publication evidence: allocation category, exact amount, percentage of total supply, vesting or release terms (if any), and the relevant public address or verifiable record where appropriate.

7. Ecosystem and Use Cases

DimeXScan Explorer

DimeXScan is the public block explorer destination intended to help users inspect network activity and verify on-chain records.

DimeX Exchange

The DimeX exchange website is an ecosystem destination. Any exchange functionality, supported assets, trading pairs, custody arrangements and user eligibility should be confirmed on the exchange platform itself.

Developer and Wallet Ecosystem

The project intends to support compatible wallets and developer tools through published network parameters and clear technical documentation. Additional integrations may be pursued as they are tested and approved.

Official destinations: https://www.dimexchain.tech | https://www.dimexscan.tech | https://www.dimex.site

8. Security and Network Operations

Blockchain security is a continuing operational responsibility. Good practice includes controlled software releases, infrastructure monitoring, validator key protection, access control, backups, incident response planning and independent review of critical code.

Independent Audit Status

This document does not claim that an independent third-party security audit has been completed. If an audit is commissioned, publish the auditor identity, audit scope, date, report and remediation status only after verifying the report and obtaining permission to publish it.

User Security

- Never share wallet seed phrases or private keys.
- Verify the chain ID, RPC endpoint and destination address before signing transactions.
- Review wallet prompts and transaction details carefully.
- Use official project links and independently verify important announcements.

9. Development Roadmap

Infrastructure Foundation — Maintain the chain, RPC access and public explorer; monitor reliability and publish accurate network information.

Documentation and Developer Access — Improve wallet setup guides, technical references and developer onboarding materials.

Ecosystem Integrations — Evaluate wallet, exchange and application integrations subject to security, technical feasibility and applicable rules.

Community and Long-Term Growth — Support developer participation, partnerships and community education while prioritising sustainable operations.

Roadmap items are directional objectives. Timing, scope and sequencing may change; no delivery date or outcome is guaranteed.

10. Governance and Compliance Considerations

The project should assess applicable company, financial-services, digital-asset, consumer-protection, sanctions, privacy and marketing requirements in every jurisdiction where it operates or targets users. Exchange-related services, fiat or stablecoin access, custody, brokerage, token distribution and other regulated activities may require specialist legal advice, licences, registrations or operational controls.

No office location, corporate registration, regulatory approval, licence or legal status is claimed in this document unless separately verified and formally authorised for publication.

11. Risk Factors

Market risk: Digital asset prices can be volatile; liquidity may be limited and users may lose some or all of the value of their holdings.

Technology risk: Software defects, consensus issues, cyberattacks, congestion, infrastructure failures or upgrades may affect network operation.

Wallet and key risk: Loss or compromise of private keys or recovery phrases may cause permanent loss of access.

Third-party risk: Wallets, exchanges, RPC providers, bridges and applications may be operated by independent parties and may fail or change their services.

Regulatory risk: Laws and regulatory requirements differ by jurisdiction and may change, potentially affecting access to services or project operations.

Roadmap risk: Future features and integrations may be delayed, changed, discontinued or never implemented.

12. Disclaimer and Glossary

This whitepaper is for general information only. It is not investment, financial, legal or tax advice and is not an offer or solicitation to purchase any digital asset. No representation or warranty is made that the network will be uninterrupted, error-free, secure in every circumstance or suitable for a particular purpose. Readers should conduct independent research and consult qualified advisers before making decisions.

DMXC — Native coin ticker identified in the DimeX Chain network configuration.

EVM — Ethereum Virtual Machine, a smart-contract execution environment.

QBFT — Quorum Byzantine Fault Tolerance, a Byzantine-fault-tolerant consensus protocol.

RPC — Remote Procedure Call endpoint used by wallets and applications to communicate with a blockchain.

Genesis configuration — The initial network configuration that defines foundational chain parameters and, where applicable, initial allocations.
